You can earn TRUST by selling or buying from/with an advertisment sucsessfully If you are advertising or interacting with an advertisment where you are trying to swindle or steal, you will recieve a negative TRUST amount which and your advertisments will automaticlly Advertise something you want to sell and get payed in Droplet TRUST usecases and how to get it Droplet Trust market, how it works TRUST is reputation points which are required to create or Succesfull Sells or purchaces are rewarded with the reputation points, TRUST The more trust you have, the higher up in the interact with advertisments. advertisments you get. TRUST reputation points is a way to promote Loyal and reliable sellers and costumers. And TRUST points is also a way to avoid/warn about fraud and theft. The Trust platform Trust To create an account, use your DPT wallet adress and set a password. The wallet will be your ID on the platform. The platform is decentralized so nothing else than a password The reputation points TRUST will help define an account. How is it safe? If an account has negative TRUST reputation, our admins will look at the account and all advertisments What is TRUST? You earn from 1-10 TRUST points when succeefully buying or selling from an advertisment, depending on the price of the advertisment TRUST is not a currency, but is reputation points. The more TRUST you have, the higher up in the advertisments catogery you get. When posting or commenting in our Forum, your post/comment will be Headlighted. The DPT you recieve when exchanging TRUST points is from the 1 TRUST point is equal to 0.001 DPT, you can exchange your Reward supply of Droplet. 20% of all Droplet coins is for rewarding trust points when you have 1000 Trust or more. contributers. TRUST enables you to use your cryptocurrency to buy what you want, localy and internationally. We look at TRUST as Ebay 2.0 Why TRUST? With TRUST we have a way to reward contribution to the Cryptocurrency network as a whole. TRUST is a store of value and is reputation points which has alot of advantages. When will this be added? We are reaching out to the world of crypto right now on every

social media platform to share the idea and make it a reality.

Currently we could create an exclusive wallet for Droplet which is

the only wallet in the world with this feature at the moment, but insted we want to share the idea so that everyone can use the feature and not just Droplet, improving the cryptocurrency network as a whole and increasing the ease and sinking the risk of

sending and using cryptocurrencies.

Znarks Privacy The exchange will support the cryptocurrencies with the biggest 24hour volumes and smaller cryptocurrencies that we want to Droplet will have its own decentralized exchange where no user creation is needed, all you need to du is to import your wallet. Decentralized exchange Username is required to make the wallet Usernames can be used to track transactions to public adresses Public wallet adress Decentralization Transactions from this adress are impossible to trace Wallet Droplet (DPT) Private wallet adress ▶ The adress changes every 24hour. The wallet can only recieve funds 30days after creation This is to make sure your funds are safe if you have lost Safe wallet For greater security The DNS "wallet adress username" service # 2FA authentication and password for access For extra security incase someone has you 2FA unit, and your Can only be accesed once every month password. No chance of sending coins to a username that doesnt exist Less risk when sending coins Benefits How it will work Easier for every day people to use a cryptocurrency as payment. A topdomain, like .COIN or .WALLET will be reserved for this infrastructure to be used You need to buy the domain you want use as a username, for example "John123". all domain names under the topdomain used for this will cost the same amount of money. Every domain name has a subdomain for every supported cryptocurrency, like bitcoin, ethereum, monero which will look like this: .xmr, .btc and .eth. The subdomains belongs to a specified cryptocurrency. The domain name you buy, forexample John123, will require you to set a recieving adress for the cryptocurrencies you want to use with the "wallet adress username" service. So when someone wants to send you a cryptocurrency, lets say Monero(xmr), they type in your username "john123" and chosses the amount and clicks on send. The DNS will then look for the domain "xmr.John123.coin". If there is no adress registered for xmr on the domain or none have purchased the domain, then there will be a warning and the funds cant be sent to the username. Lets say you want to use bitcoin (btc) and Droplet (dpt) You only need to: ▶ 1. buy the domain you want as a username 2. setup an adress for the subdomain (btc) and 3. let your friends know your username.
